```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel Ashbya gossypii orotidine-5'-phosphate decarboxylase gene (I). (I) is a selectable marker for use during the introduction of genes into microorganisms, especially those of the family Mctschnokowlaceae, specifically genera Eremothecium, Ashbya or Nematospora. The introduced genes may have regulatory activity or may be involved in the biosynthesis of chemicals, secondary metabolites, proteins, flavourings, growth factors, perfumes or enzymes. Most particularly they are involved in the biosynthesis of riboflavin or Vitamin B2, which is used as nutritional supplement in humans and animals and as a food dye. (I) is a marker that is readily selectable, transforms with higher efficiency than thr, leu or kan, and is simply counter-selected. When used in Ashbya gossypii is does not involve introduction of any foreign DNA. This sequence encodes the A. gossypii or orbidine-5'-phosphate decarboxylase protein.

The vectors also comprise: a promoter and terminator sequence selected from phosphoglyceric acid kinase (PGK), glyceraldehyde-3-phosphoric acid dehydrogenase (GAP) and protoplasmic membrane proton ATPase (PMA) genes isolated from Candida utilis; a drug resistance marker selected from aminoglycoside-3'.phosphotransferase or hygromycin B phosphotransferase; and the heterogene to be expressed. L41 confers cycloheximanine resistance on the yeast. The expression vector may also contain C. utilis rRNA gene cluster sequences, or URA3 gene sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           28-APR-1995;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           873
```

vector contains a DNA homologous with a chromosomal gene

of the yeast

```
(preferably ribosomal DNA (rDNA) such as the URA3, L41, PGK, GAP or PMA gene), a marker gene to be used in transformant selection (such as a drug resistance gene, e.g. the cycloheximide resistance gene L41, the G418 resistance gene Tm903-APT, or the hygromycin B resistance gene (from E.coll) HPT), a shortened promoter sequence such as the C.utilis L41, phosphoglycerate kinase (PGK), glyceraldehyde-3-phosphate dihydrogenase (GAP) or plasma membrane proton ATPase (PMA) gene promoter and a gene of interest from yeast or other origin. The vectors are useful in the preparation of proteins for food or drug use in high efficiency. They can be used especially for the production of single-chain monellin, which is a low-calorie sweetener whose thermostability is greater than that of the dimeric natural monellin. Multiple copies of the desired gene are integrated into the yeast chromosome and high expression efficiency

                                This sequence represents URA3 gene from K. marxianus. This gene was used in an example in the construction of the uracil requiring K. anus mutants, KMS3. This gene is involved in the regulation of the biosynthesis of pyrimidine. Yeast cells whihe have an active URA3 gene are unable to grow in medium contlaining 5-fluoro-orotic acid (5-FOA). KMS3 is a non-reverting K. marxianus leu2 strain which is suitable for overexpression of homologous or heterologous proteins is the food of the contraction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Q66476 standard;

The specification describes a method for the production of ethanol and 1,2-propanediol (1,2-PD) comprising using a genetically modified yeast which expresses suitable enzymes, particularly an E. colimethyl glyoxal synthase (MGS). The microbial process can use as a substrate a renewable sugar such as glucose, xylose or lactose or products from corn and cane sugar and from lignocellulosic biomass. The products are no toxic wastes and does not involve high temperatures and pressures. The products and methods can be used for the production of 1,2-PD which can be used in the production of unsaturated polyester resins, liquid laundry detergents, pharmaceuticals, cosmetics, antifreeze and deicing formulations. They can also be used to produce ethanol. The byproducts of fermentation are carbon dioxide, alcohols, and organic acids, all of which can be purified as valuable co-products or used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1197
                                                                                                                                                                                                                                                                                                                                                                                                                                                         1017

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               В
                                                                                  The present sequence represents a synthetic operon, comprising CC sequences encoding methylglyoxal synthase (MGS), which is functional CC in yeast cells. It is used in the course of the invention. The CC specification describes a method for the production of ethanol CC and 1,2-propanediol (1,2-pD) comprising using a genetically modified CC yeast which expresses suitable enzymes, particularly an E. coli CC process synthase (MGS). The microbial process can use as a CC substrate a renewable sugar such as glucose, xylose or lactose or products from corn and cane sugar and from lignocellulosic biomass. The products from corn and cane sugar and from lignocellulosic biomass. The products are produced in the production of the production of 1,2-pD which can be used in the production of 1,2-pD which can be used in the production of 1,2-pD which can be used in the production of unsaturated polyester cresins, liquid laundry detergents, pharmaceuticals, cosmetics, antifreeze and delaing formulations. They can also be used to produce ethanol. The byproducts of fermentation are carbon dioxide, alcohols, and organic capters feed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Methylglyoxal synthase; MGS; ethanol production; 1,2-propanediol; unsaturated polyester resin; liquid laundry detergent; cosmetic; antifreeze; deicing formulation; carbon dioxide; alcohols;

The specification describes contiginated acid sequences derived from a eukaryotic chromosome, including a neocentromere or its functional derivative or hybrid, that are able, in a compatible cell, of replicating, acting as extra-chromosomal element can degregating during cell division. The sequences can be used to construct artificial chromosomes for use in gene therapy comprising a creplicable, segregating nucleic acid that confers a specific phenotype con cells. Human artificial chromosomes for use in gene therapy comprising a creplicable, segregating nucleic acid that confers a specific phenotype con cells. Human artificial chromosomes can propagate in human cells and carry large amounts of DNA (e.g. therapeutic genes), and, being carra-chromosomal, they are not mutagenic. The artificial chromosomes can ealso useful for generation of transgenic plants and animals, in compression of cytokines, receptors and growth factors, or to increase the copy number of a gene in a cell. The constructs may also be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   identification of antimycotic agents using as a target a nucleic acid which controls an essential protein of Saccharomyces cerevisiae or from other species of Mycetes. Such agents are potentially useful clinically, in human or veterinary medicine, for treating existing infections and for preventing them in immune-depressed subjects (those with human immune deficiency virus infection or diabetes), also as fungicides and preservatives for foods and body care products. The agent are used to identify equivalent genes in other fungi, specifically Candida albicans or Aspergillus fumigatus, and equivalent human, animal and plant genes, and also for identification of antimycotic agents.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        pAT-1 (pSD544) includes: the yeast URA3 gene; a bacterial origin of replication and multicloning site; a selectable marker gene; 2 blunt-ended transposon termini (substrates for yeast retrotransposon Tyl integrase) which flank a restriction site useful for insertion of a second selectable marker gene; and a second restriction site that flanks the transposon termini. Digestion of pAT-1 at the second restriction site liberates an artificial transposon useful for DNA
                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 4164 BP; 1185 A;

DNA sequencing - using artificial transposon(s) inserted into PT target DNA by incubation with retroviral or retrotransposon PT integrase in vitro

XX Example; Columns 23-28; 38pp; English.

XX The present sequence was used in the development of a novel method CC for the determination of a target DNA sequence. The method CC comprises: (a) incubating target DNA with a retroviral or retrotransposon integrase and an artificial transposon whose termini are substrates for the integrase, to form target DNA CC molecules with quasi-randomly integrated insertions of the artificial transposon; (b) transforming host cells with the CC ansience ontaining target DNA molecules; (c) selecting transposon-containing target DNA from the transformants harbouring transposon-containing target DNA, the primer to complementary to a portion of the artificial transposon; and (f) CC extending the primer to determine a nucleotide sequence flanking CC extending the primer to determine a nucleotide sequence flanking CC is supplied as Tyl virus-like particles. The termini contain Tyl U3 sequences. The termini consist of 4-11 bp. The artificial transposon is provided by digestion with a restriction enzyme that CC generates AACA blunt ends, especially XmnI. Step (b) is effected by electroporation. The molar ratio of artificial transposon to target DNA is at least 2.5:1. Target DNA can be engineered to convert CC virtually any DNA sequence or combination of sequences into an CC feature can be easily designed and constructed.

XX Sequence 4164 BP; 1185 A; 886 C; 988 G; 1105 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
comprising a marker gene flanked by terminal sequences, each comprising at least 4 bp of a U3 sequence of yeast retrotransposon Tyl. The DNA molecule used for generating such artificial transposons comprise an origin of replication; a first selectable marker gene; two blunt-ended transposon termini, each of at least 4 bp, that are substrates for yeast retrotransposon Tyl integrase and flank a first restriction site useful for insertion of a second selectable marker gene to form an artificial transposon, and a second restriction site flanking the two transposon
                                                                                                                          This represents the nucleotide sequence of an artificial transposon AT-1 plasmid (pAT-1). The invention provides methods for creating artificial transposons and inserting these transposons into DNA targets in vitro. The artificial transposon consists of a linear blunt-ended DNA molecule
                                                                                                                                                                                                                                                                                                                                                                                         02-MAR-1995;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             termini, where digestion with the second restriction enzyme liberates blunt-ended fragment having the transposon termini at either end, the fragment being an artificial transposon. The method is useful for DNA mapping and sequencing of e.g. both functional and non-functional sequences, primer sites and restriction sites.

                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an acid trehalase (ATHI) gene-disrupted haploid yeast produced by gene manipulation, where the diploid is a practical baker's yeast. The new yeast strain is useful in dough which, upon subsequent fermentation and baking after a period of freezing, produces a high quality bread or sweetened bun. The new yeasts have a reduced ability of trehalose degradation during fermentation and thus an increased intracellular osmotic pressure, providing resistance to long term freeze-storage when used in low and high-sugar dough. The dough makes better bread than dough using prior art baker's yeast. The new strain and ATHI non-disrupted gene strains were used to prepare dough, and the new strain showed resistance to freezing. The present sequence represents an ATHI gene coding region as cleaved with URA3 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Acidic trehalase; ATH1 gene; gene manipulation; baker's yeast; dough;

Digestion of pAT-2 at the XmmI site liberates a primer island artificial transposon (PART, see T94570) useful for

c undeques with quasi-randomny integrated insertions of the artificial transposon; (b) transforming host cells with the C transposon-containing target DNA molecules; (c) selecting transposon-containing target DNA; (d) cc isolating transposon-containing target DNA; (d) cc for use as a DNA sequencing template; (e) hybridising a primer to complementary to a portion of the artificial transposon; and (f) cc the isolated transposon-containing target DNA, the primer being cc complementary to a portion of the artificial transposon; and (f) ct extending the primer to determine a nucleotide sequence flanking ct arguments. The primer to determine a nucleotide sequence flanking ct is supplied as Tyl virus-like particles. The termini contain Tyl U3 csequences. The termini consist of 4-11 bp. The artificial transposon is provided by digestion with a restriction enzyme that concernts and buint ends, especially xmnI. Step (b) is effected by clettroporation. The molar ratio of artificial transposon to target CDNA is at least 2.5:1. Target DNA can be engineered to convert curificial transposon, so custom transposons having any desired cartificial transposon, so custom transposons and desired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 14

                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence was used in the development of a novel method for the determination of a target DNA sequence. The method comprises: (a) incubating target DNA with a retroviral or retrotransposon integrase and an artificial transposon whose termini are substrates for the integrase, to form target DNA molecules with quasi-randomly integrated insertions of the artificial transposon.
                                      feature can be easily designed and constructed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example; Columns 27-32;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA sequencing - using artificial transposon(s) inserted into target DNA by incubation with retroviral or retrotransposon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Boeke JD,

This represents the nucleotide sequence of an artificial transposon AT-2 CC plasmid (pAT-2). The invention provides methods for creating artificial transposons and inserting these transposons into DNA targets in vitro. The artificial transposon consists of a linear blunt-ended DNA molecule CC comprising a marker gene flanked by terminal sequences, each comprising at least 4 bp of a U3 sequence of yeast retrotransposon Tyl. The DNA CC molecule used for generating such artificial transposons comprise an CC origin of replication; a first selectable marker gene; two blunt-ended CC transposon termini, each of at least 4 bp, that are substrates for yeast CC retrotransposon Tyl integrase and flank a first restriction site useful CC transposon, and a second selectable marker gene to form an artificial CC transposon, and a second restriction site flanking the two transposon CC termini, where digestion with the second restriction enzyme liberates a Dlunt-ended fragment having the transposon termini at either end, the CC fragment being an artificial transposon termini at either end, the CC mapping and sequencing of e.g. both functional and non-functional CC sequences, primer sites and restriction sites.
